Starting with ROS packages

- ▶ Textured Object Detection (TOD) stack
- ▶ by Willow Garage
- ▶ very experimental
- ▶ Solutions in Perception Challenge, ICRA 2011
- ▶ http://www.ros.org/wiki/tod_detecting
- ▶ http://www.ros.org/wiki/tod_training

Selecting the approach

1. Model from multiple views

2. Matching local features

3. Pose Estimation

4. *Ranking, refinement, rejection*

Describing local features - Oriented BRIEF (ORB)

“Oriented BRIEF = FAST + Harris Response + modified BRIEF”

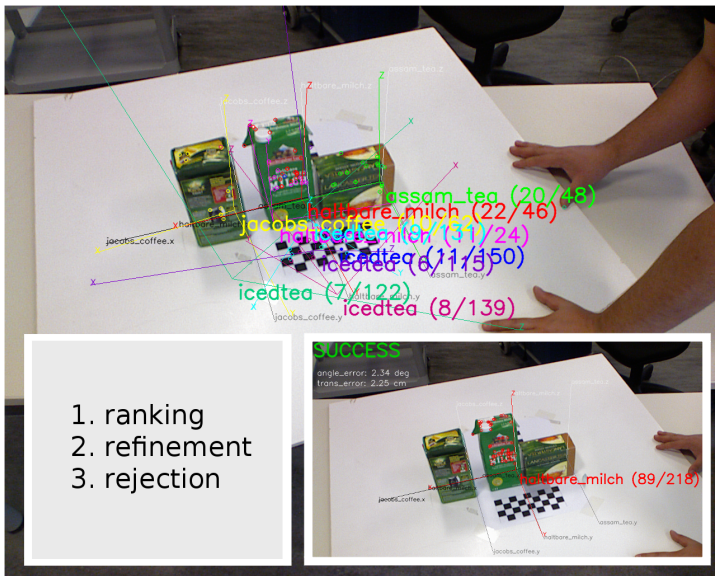

Matching local features - Locality-Sensitive-Hashing (LSH)

Estimating poses - Random Sample Consensus

Making the system robust

1. ranking
2. refinement
3. rejection

Finding good parameters

- ▶ factorial design intractable; 5 levels, 10 parameters:
 $5^{10} \approx 10^6$.
- ▶ success if errors less than 3cm and 20 degrees

- ▶ LSH does not decrease success rate
- ▶ 80% success on validation set

Evaluating the results - Many

Evaluating the results - Duplicates

Evaluating the results - Clutter

Future work

In-hand modelling

Ground truth collection for cluttered scenes

Evaluation of Willow's announced replacement of tod_*

Incorporate feature uncertainty

Include 3D information

Thank you
